

Now anyone can build a global CDN - no infrastructure required

Launch a global CDN service in a matter of days with OnApp - no infrastructure required! Using capacity from our CDN marketplace you can put your customers' video, apps and web content right where they need it - close to their audience - and create a new source of high-margin revenue.

Take your customers to 170+ locations in 43 countries.

Instant global reach, available on demand

Build your CDN using the 170+ locations on our CDN marketplace. - there's capacity available on demand across 43 countries.

The marketplace offers a rich range of price and performance options, so it's easy to create services for specific markets and types of content.

Intuitive portal and management tools

The OnApp control panel makes it easy to manage CDN provisioning, users, billing and more. It's fully customizable, and your customers can use it for provisioning, monitoring and reporting too.

We'll set up a control panel on your server hardware, or you can use a hosted control panel for a completely virtual CDN.

Free support to grow your CDN revenue

CDN has huge value for customers in e-commerce, gaming, entertainment, and any business where rapid content delivery improves sales.

You'll get you free installation, support and advice to help you generate CDN revenues as soon as possible.

How does it work?

OnApp CDN is a federated content delivery network. Your CDN service uses capacity provided by our global federation of service providers.

It's a fully managed service provided by OnApp: we assess and monitor every provider in the federation, and we broker all transactions for the capacity you need.

There are no contract tie-ins and no commits. You just pay as you go on a monthly basis.

More scale, choice and margin

Federated CDN offers much greater scale, choice and margin than reselling a legacy CDN.

Our network's already bigger than the Amazon and Microsoft CDNs combined, and you can choose exactly the mix of location, performance and price that you need.

Plus, you can give your customers lower prices and *still* get better margins, because you don't have the overhead of running a global network.

Fully managed, fully supported

Our standalone CDN package includes software, installation, training and 24x7 support.

Build many different services

OnApp CDN lets you offer a wide range of CDN services, from website acceleration (HTTP push or pull) to live streaming, video on demand and load-balanced e-commerce apps.

Fully managed & supported

The standalone CDN package includes managed installation and free 24x7 telephone and email support for your control panel, and any physical OnApp CDN servers you run.

It also includes training on configuring and running your CDN, and we're happy to help you work out how best to price, package and sell CDN to your clients.

Transparent CDN marketplace

The marketplace lets you search for available capacity by location, price and performance. We monitor and report on a range of metrics for the capacity offered on the marketplace, including uptime, IOPS, RAM, CPU and disk space.

You can combine capacity from as many different providers as you wish. All marketplace transactions are brokered and managed by OnApp.

Easy to expand

You can add your own physical edge servers to your CDN package, too, in order to create your own HTTP or video Point of Presence (PoP). If you wish, you can also publish your PoP on the marketplace, and sell your capacity to other providers.

OnApp CDN standalone package

\$500/month, including:

Software

- Control Panel
- iOS app
- API

Services

- Managed install
- Marketplace access
- 24x7 support
- Training

CDN traffic*

- 80TB

CDN marketplace bandwidth

\$0.xx /GB (prices set by each provider)

Package options

Additional CDN traffic	\$5/TB
HTTP PoP	\$50/month
Video PoP	\$100/month
Sell on the marketplace	10% of sale price

* The standalone OnApp CDN package includes 80TB of monthly CDN traffic across our core network, which uses an advanced decision engine to route content to end users via the most appropriate Point of Presence (PoP) based on location, performance, content type, CDN configuration and other factors. Content served by PoPs is charged per GB on the OnApp CDN marketplace, with prices set by each provider.
